

LedgerFlow
DOCUMENT OPERATIONS

Human-controlled document workflows.

A full-stack SaaS MVP for recurring document collection, confidence-based review, and auditable operations.

ROLE

Full-Stack Developer
Product Engineer

CORE STACK

Vue 3, TypeScript
FastAPI, SQLAlchemy

PROJECT TYPE

Independent MVP
Synthetic data

From inbox chaos to controlled workflow

The challenge

Recurring client documents arrive through fragmented channels. Teams need to know what is missing, what is late, and which extracted values still require human verification.

The solution

LedgerFlow centralizes requirements and uploads, scores extraction confidence, prevents duplicate intake, routes uncertain data to review, and records every workflow decision.

Core workflow

SYSTEM DESIGN

06

A production-minded MVP architecture

Clear boundaries make the local demo easy to run while leaving practical paths to PostgreSQL, S3, OCR, and background workers.

Built to be inspected, not just admired

The portfolio demonstrates a complete workflow and makes its MVP boundaries explicit. It does not claim production guarantees or real client outcomes.

Workflow safeguards

SHA-256 duplicate detection, 10 MB upload limit, file allowlist, confidence-based review routing, 24-hour reminder suppression, and auditable mutations.

Verified delivery

Ruff checks pass, four API workflow tests pass, Vue type checking and production build pass, and the main desktop and responsive interactions were browser-tested.

MVP boundaries

- Images are accepted but routed to review because OCR is not bundled.
- Reminder delivery is simulated as a durable workflow record.
- SQLite and local files keep the public demo portable.
- Authentication and role controls are documented production steps.

HUMAN-IN-THE-LOOP

04

Low-confidence data waits for a human

Extracted fields and routing metadata remain visible before a reviewer approves or rejects the document.

● 68% confidence | Manual confirmation required
